### **Air Source Heat Pump**

These highly efficient units use electricity to heat and cool with same unit. An Air Source Heat Pump (ASHP) is a combination of a cooling and heating system that provides all of the air conditioning and approximately 70% or more of the heating needs in a typical home in this region. ASHP units should always be sized for the cooling needs of the home. Only the compressor is controlled.

An air source heat pump qualifies for a special rate when under load management with a non-electric or storage backup heating system and cycled air conditioning.
